

**CES REPORT** This page is going to the printer on June 9 after a hectic weekend in Chicago. I was hoping for a really definitive statement on the Add-Under, but Mr. Ray George only announced that "it will be shipped by the end of the year". We did receive what I understand to be the final specifications, showing 64K of RAM, for creating your own programs, 32K of ROM, which contains the Zgrass language and the math package (trig functions, square roots, with 13 digit accuracy, etc). It is also possible to add user-generated commands or functions (stored on a tape or disc) to supplement what is already there. Two RS-232 ports are included to support the disc system, printer, or any CP/M compatible equipment you want to add. Then there is the 4K of dynamic memory used to store the screen image. Total, 100K. The price level of 600. remains. I have a six-page list of specifications and comparison charts - if you are interested, send me a self-addressed stamped envelope (legal size). I will automatically send one to each of you that responded to my question of last month. The full-screen editing function is also capable of changing and moving text characters about, and with global search and change capability, plus disc storage, one has a word processor!

**ATARI AND COMMODORE SUIT** The biggest news from the Astrocade point of view was the announcement that they had filed suit against Atari and Commodore, in which they allege that these companies have used techniques that are covered by patents under control of Astrocade. Late last year, two patents were granted (4296930 and 4301503) which define the video display technique of bit mapping (in which the status of each pixel on the tv screen is stored in memory). Astrocade feels that since they received exclusive rights to the entire system, they can press this suit. Bally is an involuntary co-plaintiff. Atari response was 'frivolous', but you didn't expect them to say 'oops'.

**VIDEOCADE SCHEDULE** Ten items were promised for delivery between now and the middle of October. First out will be The Incredible Wizard (2017) (2 players together). The next in line is Conan The Barbarian (5004), an adventure game with Conan battling over 100 monsters as he works his way thru the rooms of the maze, picking up treasures and avoiding pitfalls. (2 players) Short notes: Pirate's Chase, (2015, 2 players together); Solar

Conqueror (2018, 2 players) is a souped-up asteroid-type game with gravity and terrific color graphics; Cosmic Raiders (2019, 2 players) is the defender-type game; Bowling (3006, 4 players); Soccer (3007, 4 players) has features of both soccer and foosball and is a new entry; Artillery Duel (5005, 2 players) is our old favorite, with lots more action; Music Maker (4003, 1 player) now uses two hand controllers and a keypad overlay to give you full control over all the sound generating capabilities of the Arcade in a real-time sense. Includes a cassette interface; and Creative Crayon (4005, 1 player - 4005P with light pen) This is the old Coloring Book with much more added. There are now 23 menu commands which allow snap and show, loading to and from tape, overlaying of programs, box, line, and circle, plus adding your own custom work because in addition to the typical 8K ROM in the videocade, there will also be a 1K RAM. The light pen will have the usual photoelectric cell, but in this application, it will be located at the connector, and a fiber optic rod will be used to transmit the screen illumination to the cell. This will allow a very small bit of screen area to be picked up - to one pixel. I'm wondering when we'll get some program to allow Computer Aided Drafting after this is released.

**TV ADVERTISING STEPPED UP** 37 cities are now on the list to be receiving commercials. A new one started June 6. They will also produce another one for the Christmas sale period, emphasizing Wizard. They have also started a magazine campaign (Omni, etc). In another scheme, they will have the Wizard game played on the new 50 foot tv scoreboard screens now appearing at football stadiums.

**PLAYING GAMES IS TIRING** Yes, when you do it for hours at a time, standing up. There were about 12 of us there manning the 9 machines they had set up in towers, each with a different game. We were showing games to dealers and retailers as the various distributors made their sales pitches. The most enjoyable part of the activity was meeting a number of subscribers who have up to now been only names on a list or voices on the 'phone, plus the renewal of friendships made previously.

**FORMAT CHANGES** mentioned last month, will hopefully be completed by the October issue. We plan to add more material to the Arcadian - but will need contributions.

Printed for the mutual edification of the publisher and subscribers who are owners of the ARCADE unit, its programmable BASIC cartridges, and the ZGrass language. Printing is by a COMPRINT 912S (programs) and a NEC 8023 (text - driven by an Apple with Super-Text and Magic Window word processing systems.)

Since the Newsletter is 95 percent subscriber-generated, material is always in demand. Text material should be submitted as typewritten copy, preferably 47 characters per line and single spaced. Program material should be submitted both as a listing and on tape. Contributions are accepted without payment. However, programs entered in the Contest (accompanied by a signed statement indicating "this program is largely my own efforts and not a copy of an existing program") will be eligible for a prize. At least three programs are required for the Contest to operate. A panel of five judges will determine which of the submitted programs is "best." In addition, it is our policy to accumulate certain programs for subsequent sale on a tape, for which an author's royalty will be paid.

Due to technical difficulties, the computer printout of program listings cannot illustrate certain characters. Accordingly, the following lower case letters and characters, when found in a program listing, have these respective meanings: a = right arrow b = x (multiply) c = + (divide) \_ = left arrow ' = down arrow.

The Accountant will be very appreciative of a SASE when a response to a communication is required.

RIGEL IS BALLY BASIC ONLY Yes, I totally missed that one.

TRAVEL SCHEDULES PRECLUDED A CONTEST THIS MONTH. I've had to close off the ARCADIAN somewhat early because of Company travel, plus my attendance at the Summer CES in Chicago.

ANOTHER CONTEST!! Yes, the VIPER people are sponsoring a programming contest to run over the Summer months. This is a preliminary announcement - more details next time - but you have another month's time to think about 'what to do'. The contest rules are pretty flexible. Write a good program, in any language (old Bally Basic, new Astro Basic, Extended Basic, Machine Code), and they will give away a substantial prize of VIPER equipment to the author of the program they like the best (therefore it can be of any type). All programs become the property of VIPER, with future utilization and exploitation of the programs to be discussed with the authors. Results will be announced in the October ARCADIAN. By the way, their new telephone number is 207-623-8506.

CARTRIDGE SWAPPING - 3: Final chapter in the ongoing saga as continued from page 59. This segment describes Dave Ibach's suggestions regarding storing a subroutine inside a program to automatically allow for conversion from new AstroBasic to the older BallyBasic. Dave suggests:

-have your program in place with the new basic in the cartridge slot.

-make the first statement of your basic program look something like this:

```
1 CY=40;PRINT "SWAP NOW";CALL19900
```

This is so that after loading the program with the new basic, you can simply RUN and automatically be instructed to swap and automatically call the routine.

The last thing the routine does is to put a period {.} at %{-24574} so that this statement becomes a remark after the swap and you can RUN without executing it again.

-enter the routine like this: FOR N=19900 TO 19972 STEP 2;CY=40;INPUT %{N};NEXT N and respond to prompts with the numbers below {read down columns}. The routine is relocatable, so put it elsewhere if necessary.

-.:PRINT to record the routine along with your program.

-execute as follows: load with new basic

Dave Ibach  
19553 Dartmouth Pl.  
Northville, MI 48167

RUN  
swap to old basic  
RUN

And here is the routine:

1779	-4618	9072	21485	24398	1870	8451

MACHINE CODE PROGRAMMING on the Arcade is an area that promises to hold great development. We have had a number of examples over the last two years of programs that included some machine code programming, all written using the old Bally Basic cartridge. It may take a little while for the experimenters to become familiar enough with the new cartridge and its capabilities to write programs with it, ... but I may be surprised. Anyway, the effects are primarily those of increased program speed, better color control, foreground/background independence, and smooth movement of characters. In order to learn this technique, a new language must be learned, new rules for manipulation, and close attention to detail must be maintained. Some excellent tutorial material has been published - in Microcomputing (portions of the Kilobaud Klassroom, starting with Nov 80) by Peter Stark - in Softalk (in the Assembly Lines articles-now published as a book). The above articles describe the 6500 and 6800 families of microprocessors, but the general techniques work as well with our Z-80, just some command words are changed. The book "Programming the Z-80" by Rodney Zaks contains more than you want to know (in over 600 pages), but it has a lot of explanatory detail on every command.

We can 'talk' to the Z-80 in two ways, one is through the Basic cartridge, while the other is more direct using the Bit Fiddler cartridge. The experienced programmer, who is comfortable in writing hex code, will find the Bit Fiddler unit very valuable - see the reviews in recent issues. For the person who understands Basic fairly well and wishes to try something more advanced, the Z-80 MINI COURSE is recommended.

A review of this document by Al Rathmell follows: (see ad, p.69)

"The MINICOURSE on machine programming is in general very good. The course begins with an introduction to machine language programming principals. Part of this section was apparently extracted from the Zilog Z80 users manual. I would recommend that anyone seriously contemplating machine language programming purchase the Z80 users manual. This manual gives the detail necessary to understand the Z80 instructions.

"The section on Bally system operation gives a good description of the three custom chips which are responsible for much of the Bally's powerful graphics capability. All the input/output ports are well defined. Since the custom chips and their associated I/O ports are unique to the Bally/Astrovision system, this section is particularly valuable.

"The section on Bally Basic memory usage gives a good description of how Basic mixes graphics and program text.

"There is a good discussion on the reason hexadecimal (Base 16) numbering is used to represent binary numbers. The definition of two's complement numbers is not entirely correct. The two's complement of a number is defined as the one's complement (i.e. bit reversal) plus one. In two's complement plus and minus numbers do not complement each other but excluding a carry do sum to zero.

"The rest of the course deals with converting numbers as well as developing and loading machine language code. The use of the stack is described. The starting location of the stack is at the top rather than at the bottom as stated in the text. The alternate register set, and some of its uses is defined. There is a good description of interrupt processing - a most important aspect of machine language programming.

"The mechanics of producing machine code following this course are to convert Z80 opcodes and data into decimal numbers and poke these numbers into memory. I prefer poking the opcode and data in hexadecimal (see the program "Hex Poker" in Vol 3) since that is the standard for representing machine opcodes. In any case either method is tedious and time-consuming. An assembler is what we really need!"

**SCREEN PRINTER** While Rich Tietjens has been working on an interface with the TRS-80 for quite some time now, the solution has eluded him so far. He does have an interesting tidbit here with the capability to print the Arcade's picture off the tv screen, onto a TRS printer, their new Line Printer VII.

The included illustrations of Jekyll and Hyde and the art work were done this way. I'm going to put in a disclaimer right now - I have not personally checked this material as I do not have the equipment. Those with access to the TRS are urged to experiment and report back. (300 baud only)

LASER EVADER is a cute little game of chance. The object is to move thru a field of lasers without being hit. The five laser units fire at random, making it difficult to predict when to pass one. If you make it safely to the top, up to 100 points are added to your score, depending upon how quickly you made the trip. You continue travelling thru the laser field, accumulating points until you are 'zapped' three times, and the game is over. Use joystick to move, TRigger to restart at end of game. Remember that gravity will tend to pull you back.

Call in your order, (800) on Master card and we will deduct \$1.00 from total.  
1-812-853-6895 9AM to 9PM. est. for, NEXT DAY SHIPMENT!!

Star Fleet Command has put you at the controls of a pulse-pounding photon cannon. Your orders are to stop the invasion of aliens war machines. It takes a cool head and a steady hand. Only you stand in their way. Can Earth be saved or will the aliens destroy your cannon and invade Earth?

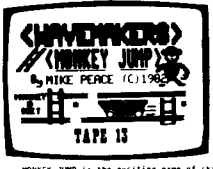

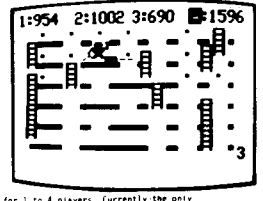

Normally, a picture this detailed in 3-dimension would require more memory than is available in the Arcade program section. We have utilized a special Arcade feature called mass screen memory. There is almost 4K of memory available in this way. The game operation is contained in the 1.8K program memory section. By using both in a unique way this game, with expanded graphics, is possible. It is equivalent to about 5K of memory.

This is probably the best use of the Arcade graphics to date and the largest most detailed play field yet developed for Basic.

NOW the number 1 coin-op game **MONKEY KONG** is simulated in Astro-BASIC and it's called:

# MONKEY JUMP

For 1 to 4 Players

MONKEY JUMP is the exciting game of skill for 1 to 4 players. Currently the only MONKEY KONG type game that exists for the home video game. It requires skill and timing to jump over holes and moving obstacles as you climb ladders to collect banana chips for points. As the level increases so does the size of the holes you must jump. Ladders vary in size and quantity to make for a different game every time. Each player remains on their own level with their own banana chips to gather.

SIDE 1 EACH PLAYER USES THEIR OWN HANDLE. SIDE 2 EACH PLAYER USES HANDLE # 1
