

3-30-79

Hi Bob.

Just wanted to check and see if you have mailed out the March issue of ARCADIAN. I have not received it as yet.

A question I would like to present is concerning the 'preprinted' statement "GAME OVER" as mentioned on p.p. 25 of the Feb. 79 issue.

One line 50 I have to use  $X = 3159$  to get a full statement. - Now - substituting 3159 for other numbers I have so far pulled these numbers & letters out of memory:

$X = \sqrt{3182} = NO 2$   
 $\sqrt{3184} = 2$   
 $X 2011 = M$   
 $\sqrt{1008} = \square$   
 $\sqrt{6002} = Q$   
 $\sqrt{6011} = D$   
 $\sqrt{8002} = P$   
 $\sqrt{8006} = U$

I was wondering if Tom Wood would know the memory locations of the alphabet, all numbers, etc. and how <sup>to use</sup> ~~use~~ them in a program - So far when I try to put two or more letters together I get a lockup.
